[A] ANTIINFLAMMATORY ACTIVITY :

Effect on adjuvant arthritis in rats :

(i) Test Method :

Ten female Sprague-Dawley rats were used per group. A dose of 0.5 mg of Mycobacterium tuberculosis (strain M37 BA) suspended in 0.05 ml of liquid paraffin was injected subcutaneously in the right hind paw. The injection of mycobacterial adjuvant produced local inflammatory lesions (primary lesion) and then about 10 days later, secondary lesions in both the injected and uninjected paws. The volumes of both paws before and on days 23 after the injection was measured as percent inhibition in comparison to vehicle-treated controls. The drug was given orally once a day for 23 consecutive days from day 1 after the injection.

(ii) Test Results :

## [B] COX-I and COX-II activity in vitro :

## (i) Test Method :

## a. Preparation of the recombinant cyclooxygenase (COX)

The human cyclooxygenase COX-I and COX-II were expressed in transfected Chinese hamster ovary (CHO) cells. Monolayer cultures of semi-confluent CHO cells stably expressing COX-I and COX-II were washed twice and scraped into phosphate buffered saline (PBS). The cells were centrifuged at 200 x g for 5 minutes and the cell pellet was sonicated in reaction buffer containing 100 mM Tris-HCl (pH 7.4), 2  $\mu$ M hematin and 5 mM tryptophan. Broken cells were centrifuged for 5 minutes at 1700 x g at 4°C and the supernatants were used as crude enzymes.

Cyclooxygenase activities in the absence or presence of inhibitors were measured by determining the level of prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) synthesis from arachidonic acid. Enzymes (1  $\mu$ g for COX-I and/or 3  $\mu$ g for COX-II) in a total volume of 200  $\mu$ l of reaction buffer were incubated in the absence and presence of various concentrations of inhibitors for 5 minutes at 30 °C. The reaction was then started by the addition of arachidonic acid to the final concentration of 10  $\mu$ M. The reaction was terminated by 50  $\mu$ l of HCl (1N) after incubation at 30°C for 5 minutes. PGE<sub>2</sub> was extracted with ethyl acetate, concentrated under a stream of nitrogen and analyzed by a radio immunoassay kit (Amersham) according to the manufacture's instructions.

## b. Assay for human recombinant COX-I and COX-II activity

COX activity was assayed as PGE<sub>2</sub> formation using radioimmunoassay to detect the prostaglandin release. The appropriate COX enzyme was

incubated in 0.1 M Tris-HCl buffer (pH 7.3) containing hematin and tryptophan with the addition of arachidonic acid (10  $\mu$ M) for 5 minutes at 37°C. Compounds were pre-incubated with the enzyme for 5 minutes prior to the addition of arachidonic acid. Any reaction between the arachidonic acid and the enzyme was stopped after 5 minutes at 37°C by addition of 20  $\mu$ l of 1N HCl. PGE<sub>2</sub> formation was measured by radioimmunoassay (Amersham).

The mixture containing 4,4-difluoro-1-[(4-methylthio)phenyl]-butane-1,3-dione (1.0 g), (3-chloro-4-methoxyphenyl)hydrazine hydrochloride (0.94 g) and acetic acid (20 ml) was stirred at 100-110°C. After 2 hours, the reaction mixture was concentrated in vacuo. The resultant residue was partitioned between ethyl acetate and water. The organic layer was separated, washed with water and dried over magnesium sulfate. Evaporation of the solvent under reduced pressure gave 1-(3-chloro-4-methoxyphenyl)-3-(difluoromethyl)-5-[4-(methylthio)phenyl]pyrazole (2.10 g) as an oil.

### Preparation 7

A mixture of 1-(4-methoxy-3-nitrophenyl)-5-[4-(methylsulfonyl)-phenyl]pyrazole-3-carbonitrile (1.8 g) and ammonium chloride (0.18 g) in ethanol-water (50 ml) was stirred under 90°C. After several minutes, iron (powder) (1.8 g) was added and the resulting mixture was stirred for 1.5 hours at same temperature. After cooling, the insoluble material was filtrated off and washed with tetrahydrofuran. The filtrate was concentrated under reduced pressure to give a material which on treatment with 4N hydrogen chloride in ethyl acetate afforded 1-(3-amino-4-methoxyphenyl)-5-[4-(methylsulfonyl)-phenyl]pyrazole-3-carbonitrile hydrochloride (1.8 g).

### Preparation 8

To a mixture of (3-methoxyphenyl)hydrazine (6 g) and 3-[4-(methylthio)phenyl]acrylonitrile (5.7 g) in methanol (100 ml) was added sodium methoxide (28 wt. % solution in methanol) (18 ml) at ambient temperature. The mixture was heated to dryness under nitrogen at 140°C for 30 minutes. The resultant orange mass was partitioned between dichloromethane and ice water. The organic layer was dried over magnesium sulfate, and then filtered. This filtrate was evaporated in vacuo. The resultant mass was dissolved in ethyl acetate (150 ml) and refluxed for 1 hour in the presence of magnesium(IV) oxide (20 g). This mixture was cooled, and filtered. The filtrate was evaporated in vacuo. The resultant mass was purified by column chromatography on silica gel using dichloromethane as eluent to give {1-(3-methoxyphenyl)-5-[4-(methylthio)-phenyl]pyrazol-3-yl}amine (5.2 g).

A solution of sodium nitrite (4.0 g) in water (7 ml) was added to an ice cooled mixture of 3-cyano-4-methoxyaniline (7.7 g) and concentrated hydrochloric acid (21 ml). The mixture was stirred at 0 °C for 30 minutes. To the resultant mixture a solution of tin(II) chloride dihydrate (49 g) and concentrated hydrochloric acid (5 ml) was added at 0°C and stirred for 1 hour. The precipitates were filtered and washed with ice cooled concentrated hydrochloric acid (10 ml) to give crude (3-cyano-4-methoxyphenyl)hydrazine hydrochloride (14.8 g).

#### Preparation 15

A stirred mixture of (3-cyano-4-methoxyphenyl)hydrazine hydrochloride (3.7 g), 3-[4-(methylthio)phenyl]acrylonitrile (2.3 g) and sodium methoxide (0.9 g) in methanol 13 ml was gradually heated to 140°C under atmospheric pressure and  $\text{N}_2$  atmosphere, and continued to heat for 8 hours at 140°C. Ethyl acetate and water were added to the reaction mixture. The organic layer was separated, washed with brine, dried over magnesium sulfate, and concentrated under reduced pressure to give crude 1-(3-cyano-4-methoxyphenyl)-5-[4-(methylthio)phenyl]-2-pyrazoline-3-amine (4.0 g).

#### Preparation 16

A mixture of 1-(3-cyano-4-methoxyphenyl)-5-[4-(methylthio)phenyl]-2-pyrazoline-3-amine (4.0 g) and manganese(IV) oxide (6.0 g) in

toluene (100 ml) was stirred at ambient temperature for 8 hours. The insoluble material was filtered and washed with ethyl acetate. The resulting solution was concentrated under reduced pressure. To a solution of 1-(3-amino-4-methoxyphenyl)-5-[4-(methylsulfonyl)phenyl]-3-(trifluoromethyl)pyrazole hydrochloride (0.80 g) in ca. 24% hydrobromic acid (16 ml) was added a solution of sodium nitrite (0.14 g) in water (1 ml) while the internal temperature of the reaction mixture was maintained below 0°C. The above mixture was added to an ice-cooled solution of copper(I) bromide (0.30 g) in ca. 24% hydrobromic acid (8 ml) and the mixture was stirred at ambient temperature for 1.5 hours. The reaction mixture was extracted with ethyl acetate and the organic layer was washed with brine, dried over anhydrous magnesium sulfate, and concentrated in vacuo. The residue was purified by column chromatography on silica gel (elution with chloroform) to give the product, which was recrystallized from diisopropyl ether (3 ml)-ethyl acetate (3 ml) to give 1-(3-bromo-4-methoxyphenyl)-5-[4-(methylsulfonyl)phenyl]-3-(trifluoromethyl)-pyrazole (0.39 g).

To a solution of {1-(3-methoxyphenyl)-5-[4-(methylthio)phenyl]-pyrazole-3-yl}amine (5 g) in acetic acid (40 ml) and hydrochloric acid (10 ml) was added sodium nitrite (1.7 g) in water (3 ml) at 0°C. This mixture was stirred at 0 °C for 1 hour. The diazonium salt prepared above was added to a solution of copper(I) chloride (7 g) in hydrochloric acid (10 ml) at 0°C, and then allowed to warm to ambient temperature. After 1 hour, the reaction mixture was poured into ice water, and extracted with dichloromethane. The organic layer was dried over magnesium sulfate, and filtered. The filtrate was evaporated in vacuo and purified by column chromatography on silica gel eluting with a mixed solution of dichloromethane and n-hexane (1:1). The desired product was dissolved in methanol (100 ml). A solution of Oxone® (potassium peroxy monosulfate) (20 g) in water was added at room temperature and the resultant mixture was stirred for 1 hour and then filtered. The filtrate was extracted with dichloromethane, and washed with water twice. The organic layer was dried over magnesium sulfate, and filtered. The filtrate was evaporated in vacuo to give 3-chloro-1-(3-methoxyphenyl)-5-[4-(methylsulfonyl)phenyl]pyrazole (1.32 g).

#### Example 11

A solution of sodium nitrite (0.1 g) in water (0.2 ml) was added

a solution of 1-(4-amino-3-methoxyphenyl)-3-chloro-5-[4-(methylsulfonyl)phenyl]pyrazole (0.38 g) in concentrated hydrochloric acid (2 ml) at 0°C with stirring. The reaction mixture was stirred at 0°C for 1 hour. 42% Tetrafluoroboric acid (0.5 ml) was added to the solution containing the diazonium salt at 0°C. The resulting mixture was stirred at 0°C for 2 hours and then left in a refrigerator overnight. The resulting precipitate was collected by filtration, washed with ice water and dried in vacuo, which was heated at 180-200°C for 10 minutes. Ice water was added and the resulting mixture was extracted with a mixture of tetrahydrofuran and ethyl acetate (1:1). The extract was washed with brine, dried over magnesium sulfate and evaporated under reduced pressure. The residue was subjected to column chromatography on silica gel using a mixture of isopropyl ether and tetrahydrofuran (5:1) as eluent to give 3-chloro-1-(4-fluoro-3-methoxyphenyl)-5-[4-(methylsulfonyl)phenyl]pyrazole (55mg).
